2-Day Crash Course

Zero to Pro Interview Prep — Evaratus QA Intern (RL Environments)

This is a tight 2-day plan built around your actual background — a final-year CSE (AI) student with hands-on project experience in web development, Python, and automation (your Sheets-to-LinkedIn AI pipeline project). You have no formal QA experience yet, and that's completely fine — this plan gets you interview-ready, plus personalized answers for common HR questions.

DAY 1 — Technical Foundation (Morning to Evening)

Block 1 (1 hr): QA Basics

- QA means checking if software works correctly before it reaches users
- Manual testing = you click through the app yourself. Automation testing = a script does the clicking for you
- Learn these 4 simple terms: regression testing (checking old features still work after a change), smoke testing (quick check that basics work), sanity testing (quick check after a small fix), exploratory testing (freely trying things to find hidden issues)

Block 2 (1 hr): Bug Reports

- Learn the structure: Title, Steps to Reproduce, Expected Result, Actual Result, Screenshot, Severity, Priority
- Severity = how badly broken it is. Priority = how soon it needs fixing
- Practice: find one small issue in any app on your phone and write a full bug report for it

Block 3 (1.5 hr): REST API Basics

- An API lets two systems talk to each other by sending requests and getting responses
- GET = read data, POST = create data, PUT = update data, DELETE = remove data
- Status codes: 200 success, 201 created, 400 bad request, 401 unauthorized, 404 not found, 500 server error
- Install Postman and try one GET request to any free public API to see a request/response live

Tip: You already understand data flow from your Expense Tracker (Python + SQLite) project — APIs work on a similar request-and-response idea, just over the internet.

Block 4 (1 hr): Automation Testing Concepts

- Automation testing tools (Selenium, Playwright, Cypress) let you write code that tests a website automatically, instead of clicking manually every time
- You don't need to master these — just be able to explain what they're for
- Since you already know JavaScript and DOM manipulation from your To-Do List app, you can honestly say you understand the building blocks these tools automate

Block 5 (1.5 hr): RL Environments & Graders (Role-Specific — Most Important)

- The company builds fake/simulated office software (like a mock CRM) so AI can practice real work
- A 'task' is an instruction given to the AI (e.g. 'update this customer's phone number')
- A 'grader' is an automatic checker that decides if the AI did the task correctly — pass or fail
- Your job: check that tasks are clear, and that the grader's pass/fail logic is actually correct

Tip: Simple memory trick: App = practice room. Task = the question. Grader = the answer key. You check all three for mistakes.

DAY 2 — Practice, Assignment Review & Interview Questions

Block 1 (1 hr): Practice Spotting Grader Problems

- Pick a simple app idea (like your To-Do List project) and write one task, e.g. 'Mark the grocery task as done'
- Write a simple pass/fail rule for it — this is your practice grader
- Try to complete the task in a slightly different valid way — does your grader still work?
- Ask: could this task be understood two different ways? If yes, that's exactly the kind of issue you'd flag in this job

Block 2 (1 hr): Review Your Assignment

- Re-read every bug you found in your submitted assignment
- For each one, be ready to explain: what you found, how you found it, and why it matters
- Be honest about anything you might have missed if asked — this shows self-awareness

Block 3: General Interview Questions (with personalized sample answers)

1. Tell me about yourself

Sample answer: I'm a final-year B.Tech Computer Science student specializing in AI, currently building hands-on projects around web development and automation. I've built a food ordering website using HTML, CSS, and Bootstrap, a to-do list app with JavaScript, an expense tracker using Python and SQLite, and an AI-powered automation pipeline that summarizes data with Gemini and auto-publishes to LinkedIn. Through these projects, I've learned to pay close attention to detail, think through edge cases, and debug systematically — which is exactly why I'm excited about this QA role. I'm looking to apply that same attention to detail to testing AI training environments.

2. Why should we hire you?

Sample answer: I may not have formal QA work experience, but my project background shows the exact traits this role needs: I've built full working applications end-to-end, so I understand how software is supposed to behave, which makes it easier to spot when it doesn't. My automation pipeline project also means I already think in terms of workflows and step-by-step logic, which directly applies to checking whether AI tasks and grading logic are correct. I'm also genuinely detail-oriented — I enjoy noticing small inconsistencies, which is core to this job.

3. Why do you want to work in QA / at this company?

Sample answer: I'm interested in AI and how it's trained to do real-world work, and QA for RL environments sits right at that intersection — making sure AI learns from correct examples. It's a chance to combine my technical background with a role that has real responsibility, since my sign-off directly affects what an AI model learns.

4. What is your biggest strength?

Sample answer: Attention to detail and persistence in debugging. When I built my expense tracker, I had to carefully test every CRUD operation to make sure data was being saved and updated correctly — I naturally double-check edge cases rather than assuming something works.

5. What is your biggest weakness?

Sample answer: I don't have hands-on experience with dedicated QA or automation tools like Selenium yet, but I've been actively learning the concepts and I pick up new tools quickly, as shown by how fast I built projects across multiple different tech stacks.

6. Tell me about a project you're proud of

Sample answer: My AI-powered social media automation pipeline — I connected Google Sheets, Gemini AI, and LinkedIn's publishing flow into one no-code pipeline. It taught me how to think about a full workflow end-to-end, and how a small error in one step can break the whole pipeline — which is very similar to how one wrong task or grader step can affect an entire AI training environment.

7. How do you handle tight deadlines or pressure?

Sample answer: During my final year, I balanced coursework with building multiple personal projects simultaneously. I handle pressure by breaking tasks into smaller steps and prioritizing the most critical parts first, which I imagine applies directly to QA rounds with tight timelines.

8. Do you have any questions for us?

(Always say yes — refer to your earlier 'Questions to Ask Interviewer' PDF for simple ones to use.)

Quick Summary — 2 Day Plan at a Glance

Day	Focus
Day 1	QA basics, bug reports, REST APIs, automation testing concepts, RL environments & graders
Day 2	Practice exercises, assignment review, general interview questions with personalized answers

Golden rule: you don't need to be a QA expert in 2 days — you need to sound confident, curious, and detail-oriented, and connect your existing project experience to this role's needs.
